Singular Value Decomposition (SVD) tutorial

BE.400 / 7.548

Singular value decomposition takes a rectangular matrix of gene expression data (defined as A, where A is a $n \times p$ matrix) in which the n rows represents the genes, and the p columns represents the experimental conditions. The SVD theorem states:

$$\mathbf{A}_{nxp} = \mathbf{U}_{nxn} \, \mathbf{S}_{nxp} \, \mathbf{V}^{\mathbf{T}}_{pxp}$$

Where

$$\begin{aligned} \mathbf{U}^T\mathbf{U} &= \mathbf{I}_{nxn} \\ \mathbf{V}^T\mathbf{V} &= \mathbf{I}_{DXD} \ \ \text{(i.e. U and V are orthogonal)} \end{aligned}$$

Where the columns of U are the left singular vectors (*gene coefficient vectors*); S (the same dimensions as A) has singular values and is diagonal (*mode amplitudes*); and V^T has rows that are the right singular vectors (*expression level vectors*). The SVD represents an expansion of the original data in a coordinate system where the covariance matrix is diagonal.

Calculating the SVD consists of finding the eigenvalues and eigenvectors of AA^T and A^TA . The eigenvectors of A^TA make up the columns of V, the eigenvectors of AA^T make up the columns of U. Also, the singular values in S are square roots of eigenvalues from AA^T or A^TA . The singular values are the diagonal entries of the S matrix and are arranged in descending order. The singular values are always real numbers. If the matrix A is a real matrix, then U and V are also real.

To understand how to solve for SVD, let's take the example of the matrix that was provided in Kuruvilla *et al*:

$$A = \begin{bmatrix} 2 & 4 \\ 1 & 3 \\ 0 & 0 \\ 0 & 0 \end{bmatrix}$$

In this example the matrix is a 4x2 matrix. We know that for an $n \times n$ matrix W, then a nonzero vector \mathbf{x} is the eigenvector of W if:

$$\mathbf{W} \mathbf{x} = \mathbf{l} \mathbf{x}$$

For some scalar l. Then the scalar l is called an eigenvalue of A, and \mathbf{x} is said to be an eigenvector of A corresponding to l.

So to find the eigenvalues of the above entity we compute matrices AA^T and A^TA . As previously stated, the eigenvectors of AA^T make up the columns of U so we can do the

following analysis to find U.

Now that we have a n x n matrix we can determine the eigenvalues of the matrix W. Since W $\mathbf{x} = l \mathbf{x}$ then $(W-lI) \mathbf{x} = 0$

$$\begin{bmatrix} 20 - \lambda & 14 & 0 & 0 \\ 14 & 10 - \lambda & 0 & 0 \\ 0 & 0 & -\lambda & 0 \\ 0 & 0 & 0 & -\lambda \end{bmatrix} \mathbf{x} = (W - \lambda I)\mathbf{x} = 0$$

For a unique set of eigenvalues to determinant of the matrix (W-II) must be equal to zero. Thus from the solution of the characteristic equation, |W-II|=0 we obtain: l=0, l=0; $l=15+\ddot{O}221.5\sim29.883$; $l=15-\ddot{O}221.5\sim0.117$ (four eigenvalues since it is a fourth degree polynomial). This value can be used to determine the eigenvector that can be placed in the columns of U. Thus we obtain the following equations:

$$19.883 x1 + 14 x2 = 0$$

 $14 x1 + 9.883 x2 = 0$
 $x3 = 0$
 $x4 = 0$

Upon simplifying the first two equations we obtain a ratio which relates the value of x1 to x2. The values of x1 and x2 are chosen such that the elements of the S are the square roots of the eigenvalues. Thus a solution that satisfies the above equation x1 = -0.58 and x2 = 0.82 and x3 = x4 = 0 (this is the second column of the U matrix).

Substituting the other eigenvalue we obtain:

$$-9.883 x1 + 14 x2 = 0$$

 $14 x1 - 19.883 x2 = 0$
 $x3 = 0$
 $x4 = 0$

Thus a solution that satisfies this set of equations is x1 = 0.82 and x2 = -0.58 and x3 = x4 = 0 (this is the first column of the U matrix). Combining these we obtain:

$$U = \begin{bmatrix} 0.82 & -0.58 & 0 & 0 \\ 0.58 & 0.82 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

Similarly A^TA makes up the columns of V so we can do a similar analysis to find the value of V.

$$A^{T}.A = \begin{bmatrix} 2 & 4 & 0 & 0 \\ 1 & 3 & 0 & 0 \end{bmatrix} \begin{bmatrix} 2 & 4 \\ 1 & 3 \\ 0 & 0 \\ 0 & 0 \end{bmatrix}$$

and similarly we obtain the expression:

$$V = \begin{bmatrix} 0.40 & -0.91 \\ 0.91 & 0.40 \end{bmatrix}$$

Finally as mentioned previously the S is the square root of the eigenvalues from AA^T or A^TA . and can be obtained directly giving us:

$$S = \begin{bmatrix} 5.47 & 0 \\ 0 & 0.37 \\ 0 & 0 \\ 0 & 0 \end{bmatrix}$$

Note that: s1 > s2 > s3 > ... which is what the paper was indicating by the figure 4 of the Kuruvilla paper. In that paper the values were computed and normalized such that the highest singular value was equal to 1.

Proof:

$$\mathbf{A} = \mathbf{U}\mathbf{S}\mathbf{V}^{\mathrm{T}}$$
 and $\mathbf{A}^{\mathrm{T}} = \mathbf{V}\mathbf{S}\mathbf{U}^{\mathrm{T}}$
 $\mathbf{A}^{\mathrm{T}}\mathbf{A} = \mathbf{V}\mathbf{S}\mathbf{U}^{\mathrm{T}}\mathbf{U}\mathbf{S}\mathbf{V}^{\mathrm{T}}$
 $\mathbf{A}^{\mathrm{T}}\mathbf{A} = \mathbf{V}\mathbf{S}^{2}\mathbf{V}^{\mathrm{T}}$
 $\mathbf{A}^{\mathrm{T}}\mathbf{A}\mathbf{V} = \mathbf{V}\mathbf{S}^{2}$
